

Design document

additional features

- Convert menu from css to jquery
 - Fix previous issue; broken style when side menu and dropdown menu are active at the same time
 - Close side/dropdown menu when click outside
- Style
 - Center login/register forms vertically
 - Fix index page title background height for mobile
- Store if user close warning in cookie for 3 month

Implementation evaluation

Convert menu implementation from CSS, allowing more dynamic features such as dynamic features and **click outside**. Storing warnings show status in cookies because it's really annoying to click close every redirect. I also update some styles to make the pages look better. Some required features were already implemented in previous iterations like mobile pages and forms. There aren't any major changes from initial design, just mostly change from css to js and some additional js features.

Testing

Using vscode [live server](#) extension with edge debugger tool to test responsive features. The website is fully responsive supporting all popular device dimension
